Section 1 : Coding

1. Problem Statement

Gloria is responsible for monitoring the performance of two machines in a factory. She needs to determine which of the two machines is operating closest to the optimal temperature of 100 degrees Celsius using the relational operator.

Assist Gloria in displaying the machine's temperature, which is closer to 100, and the difference from 100.

Input Format

The first line of input consists of an integer N, representing the temperature of the first machine.

The second line consists of an integer M, representing the temperature of the second machine.

Output Format

The output prints "The integer closer to 100 is X with a difference of Y" where X is the temperature of the closer machine and Y is the difference from 100.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 90
80
Output: The integer closer to 100 is 90 with a difference of 10

Answer

```java
// You are using Java
import java.util.Scanner;

class gloria
{
    public static void main(String[] args)
    {
        Scanner scan = new Scanner(System.in);

        int x = scan.nextInt();
        int y = scan.nextInt();

        int diff1 = Math.abs(100 - x);
        int diff2 = Math.abs(100 - y);

        if(diff1<diff2)
        {
            System.out.println("The integer closer to 100 is "+x+" with a difference of "+ diff1);
        }
        else if(diff2<diff1)
        {
            System.out.println("The integer closer to 100 is "+y+" with a difference of "+ diff2);
        }
    }
}
```

```
    }
```

1. PROBLEM STATEMENT:

Dave got two students who wants help with their doubt. Each handouts an integer and wants to find if one Integer Positive While the Other is Not Divisible by 3. Write a program to achieve this and conclude for them.

Input Format

The first line of input represents the first integer.

The second line of input represents the second integer.

Output Format

The output should display as "One of the integers is positive while the other is not divisible by 3." or "Neither of the integers meets the condition."

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 4
3

Output: One of the integers is positive while the other is not divisible by 3.

Answer

```java
// You are using Java
import java.util.Scanner;

class dave
{
    public static void main(String[] args)
    {

        Scanner scan = new Scanner(System.in);

        int x = scan.nextInt();
        int y = scan.nextInt();

        if ((x>0 && y%3!=0)||(y>0 && x%3!=0))
        {
            System.out.println("One of the integers is positive while the other is not divisible by 3.");
        }
        else
        {
            System.out.println("Neither of the integers meets the condition.");
        }
    }
}
```

1. Problem statement

Manoj, a developer at MoneyMatters Inc., is working on improving the company's financial system. He needs to create a program that takes an integer input, converts it into a double, and displays both the original integer and the converted double value.

Input Format

The input consists of a single integer representing a monetary amount.

Output Format

The first line of the output displays the "Original Integer: ", followed by an integer representation of the input value.

The second line displays the "Converted Double: ", followed by a double value representing the input as a decimal value.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 20
Output: Original Integer: 20
Converted Double: 20.0

Answer

```java
// You are using Java
import java.util.Scanner;

class developer
{
    int x;

    void getdetail()
    {
        Scanner scan = new Scanner(System.in);
        x = scan.nextInt();
    }
    void showdetail()
    {
        System.out.println("Original Integer:"+x);
        System.out.println("Converted Double:"+ (double) x);
    }
    public static void main(String[] args)
    {
        developer dev = new developer();
        dev.getdetail();
        dev.showdetail();

1. Problem Statement

Vishal and Arun are discussing the properties of numbers. Vishal gives Arun two integers. He asks Arun to check if the sum of these two numbers is a multiple of their product.

Can you assist Arun and determine whether the sum is a multiple of the product?

Input Format

The input consists of two space-separated integers.

Output Format

The output prints:

1. "Sum is Multiple of Product" if the sum of the two numbers is divisible by their product.
2. "Sum is Not Multiple of Product" otherwise.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1 2

Output: Sum is Not Multiple of Product

Answer

```java
// You are using Java
import java.util.Scanner;

class addition
{
    public static void main(String[] args)
    {
        Scanner scan = new Scanner(System.in);
        int x = scan.nextInt();
        int y = scan.nextInt();
        int z = x+y;
        int d = x*y;

        if (z%d==0)
        {
            System.out.println("Sum is Multiple of Product");
        }
        else
        {

1. Problem Statement:

Emily has a beautiful circular garden in her backyard. She's interested in calculating two important measurements for her garden: the circumference and the area. To do this, she needs a program that can take the radius of her circular garden as input and provide the calculated circumference and area as output. The formulas she should use are as follows:

To calculate the circumference (C) of a circle, you can use the formula:

C = 2 * π * r

A = π * r^2

Where:

C represents the circumference.

A represents the area.

π (pi) is approximately 3.14159.

r is the radius of the circle.

Emily is not a programmer, and she needs your help to create a program that will make these calculations for her garden.

Input Format

The first line of input contains a single double-point number radius, representing the radius of the circle.

Output Format

The output should consist of two lines:

The first line should print the circumference of the circle rounded to 2 decimal places, followed by the unit "meters".

The second line should print the area of the circle rounded to 2 decimal places, followed by the unit "square meters".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3.0
Output: Circumference: 18.85 meters
Area: 28.27 square meters

Answer

```java
// You are using Java
import java.util.Scanner;

class calculate
{
    double radius;
    double c;
```

```java
        double a;
        double pi = 3.14159;
        void getdetail()
        {
            Scanner scan = new Scanner(System.in);
            radius = scan.nextDouble();
        }

        void circumference()
        {
            c = 2*pi*radius;
            a = pi*(radius*radius);

        }
        void showdetail()
        {
            System.out.printf("Circumference: %.2f meters\n",c);
            System.out.printf("Area: %.2f square meters",a);
        }
        public static void main(String[] args)
        {
            calculate cal = new calculate();
            cal.getdetail();
            cal.circumference();
            cal.showdetail();
        }
    }
```

1. Problem Statement

Joey is learning about bitwise operations and is working on a project that involves extracting specific bits from integers. He needs to write a program that takes an integer and the number of bits N as input and outputs the value of the lowest N bits of the integer.

Help Joey in his project to understand and visualize how bitwise operations work in practical scenarios.

Input Format

The first line of input consists of an integer X, representing the given integer.

The second line consists of an integer N, representing the number of bits to extract.

Output Format

The output displays "Result: " followed by an integer representing the value of the lowest N bits of the given integer.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 85
2
Output: Result: 1

Answer

```java
// You are using Java
import java.util.Scanner;

class BitwiseExtract {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        int x = scanner.nextInt();

        int n = scanner.nextInt();

        int mask = (1 << n) - 1;

        int result = x & mask;

        System.out.println("Result: " + result);
    }
}

1. Problem Statement

In the Kingdom of Finance, the royal treasury is managed by the treasurer, Sir Cedric. Sir Cedric tracks the daily expenses of the kingdom using an expense report that lists three major categories: food, clothing, and utilities. However, the King wants to know if the average daily expense is greater than at least two of these categories to ensure the kingdom is spending wisely.

Your task is to help Sir Cedric determine if the average daily expense is greater than two of the categories. Specifically, you need to calculate the average of the three expenses and check if it is greater than any two categories.

Note: Use the ternary operator

Input Format

Three integers a, b, and c represent the daily expenses for food, clothing, and utilities. Each integer is provided on a single line.

Output Format

The average of the three expenses, rounded to two decimal places.

A message indicating whether the average is greater than at least two of the expense categories.

1. If the average is greater than the two smallest monthly expenses, print "Average is greater than both X and Y," where X and Y are the two smallest expenses.
2. Otherwise, display "Average is not greater than two smallest expenses".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 4
6
10
Output: 6.67
Average is greater than both 4 and 6

Answer

```java
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner scan = new Scanner(System.in);
        int a = scan.nextInt();
        int b = scan.nextInt();
        int c = scan.nextInt();
        double avg = (double)(a+b+c)/3.0;
        System.out.printf("%.2f%n", avg);
        if(avg>a && avg>b){
            System.out.printf("Average is greater than both %d and %d", a,b);
        }
```

```java
        else if(avg>a && avg>c){
            System.out.printf("Average is greater than both %d and %d", a,c);
        }
        else if(avg>b && avg>c){
            System.out.printf("Average is greater than both %d and %d", b,c);
        }
        else{
            System.out.println("Average is not greater than two smallest expenses");
        }
    }

}
```

1. Problem Statement

Phill is a quality control manager at a manufacturing plant. He needs to verify if a sensor reading at a midpoint station (S2) falls exactly halfway between the readings of the previous station (S1) and the next station (S3). Help him by developing a program that checks if the second sensor reading is the average (midpoint) of the first and third sensor readings.

Use the relational operator to solve the program.

Input Format

The first line of input consists of an integer S1, representing the sensor reading of the first station.

The second line consists of an integer S2, representing the sensor reading of the midpoint station.

The third line consists of an integer S3, representing the sensor reading of the next station.

Output Format

The first line of output displays a boolean value representing whether the sensor reading at the midpoint station is halfway between the readings of the first and the next stations.

The second line displays one of the following:

1. If the result is true, print "The second integer is halfway between the first and third integers."
2. Otherwise, print "The second integer is not halfway between the first and third integers."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1
7
10
Output: false
The second integer is not halfway between the first and third integers.

Answer

```java
// You are using Java
import java.util.Scanner;
class station
{
    int s1;
    int s2;
    int s3;
    int avg;
    boolean bool1 = true;

    void getdetails()
    {
        Scanner scan = new Scanner(System.in);
```

```java
        s1 = scan.nextInt();
        s2 = scan.nextInt();
        s3 = scan.nextInt();
    }
    void showdetails()
    {
        avg = (s1+s3)/2;
        if(avg==s2)
        {

            System.out.println(bool1);
        }
        else
        {
            bool1 = false;
            System.out.println(bool1);
        }
    }
    void bool()
    {
        if(bool1)
        {
            System.out.println("The second integer is halfway between the first and
third integers.");
        }
        else
        {
            System.out.println("The second integer is not halfway between the first
and third integers.");
        }
    }

    public static void main(String[] args)
    {

1. Problem Statement

Aishu is supervising a construction project that needs to be completed with the help of three workers: A, B, and C.

She knows how many days each of them would take to complete the entire project individually:

A can complete it in x days,B in y days,C in z days.

Initially, all three workers (A, B, and C) work together for d1 days.

After that, C leaves, and only A and B continue for another d2 days.

Then B also leaves, and A works alone to finish the remaining work.

Your tasks is to help aishu to implement this functionality using the class WorkDistribution and Method calculateWork(int x, int y, int z, int d1, int d2)

Calculate the total work completed in the first d1 days by A, B, and C.Calculate the work completed in the next d2 days by A and B.Determine the remaining work after these d1 + d2 days.

Input Format

The first line of input contains five space-separated integers: x y z d1 d2

where:

x represents the Days A takes to complete the work alone

y represents the Days B takes to complete the work alone

z represents the Days C takes to complete the work alone

d1 represents the Days A, B, and C work together

d2 represents the Days A and B work together (after C leaves)

Output Format

The first line of output prints "Work done in first d1 days (A+B+C): " followed by a double value rounded to 2 decimal places.

The second line of output prints "Work done in next d2 days (A+B): " followed by a double value rounded to 2 decimal places.

The third line prints "Remaining work: " followed by a double value rounded to 2 decimal places.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 10 20 30 2 2

Output: Work done in first d1 days (A+B+C): 0.37
Work done in next d2 days (A+B): 0.30
Remaining work: 0.33

Answer

```java
// You are using Java
import java.util.Scanner;

class work
{
    int a;
    int b;
    int c;
    int d1;
    int d2;
    double first,second,remain;

    void getdetails()
    {
        Scanner scan = new Scanner(System.in);
        a = scan.nextInt();
        b = scan.nextInt();
        c = scan.nextInt();
        d1 = scan.nextInt();
        d2 = scan.nextInt();
    }
    void showdetails()
    {
        first = d1*(1.0/a + 1.0/b + 1.0/c);
        second = d2*(1.0/a + 1.0/b);
        remain = 1.0 - (first+second);
        System.out.printf("Work done in first d1 days (A+B+C): %.2f\n",first);
        System.out.printf("Work done in next d2 days (A+B): %.2f\n",second);
        System.out.printf("Remaining work: %.2f",remain);
    }
    public static void main(String[] args)
    {
        work obj = new work();
        obj.getdetails();
        obj.showdetails();
    }
}
```
